

Building Bridges to Medical Miracles

The **Wake Forest Institute for Regenerative Medicine (WFIRM)** is a global leader in translating scientific discoveries into life-saving clinical therapies, aiming to cure rather than merely treat disease. They were the first to engineer laboratory-grown organs successfully implanted into humans. Today, they are developing over 40 different replacement tissues and organs—including bio-printed kidneys, liver tissues, and custom cell therapies—to eliminate the organ shortage and prevent immune rejection.

Together with General Grand Chapter, California Eastern Star supports WFIRM to raise awareness and funds for these life-saving advances. You too can help more people benefit from regenerative healthcare innovations.
